Project Deliverable P1
Proposal and Requirements

Proposed Project: Campus Map System

Draft baseline — version 0.1 · 15 October 2026

Field	Entry
Project title	CampusCompass — Campus Map System (working title; team to approve)
Team number and section	Team 11 - 3354.003
Team members	Riven Amdal; Cyril Canete; Michael Dezeeuw; Arsh Heer; Kaylee Vo; Jay Windisch
Repository URL	
Document version	0.1
Date	15 October 2026

0 Revision History and Contribution Record

Version	Date	Author	Summary of change
0.1	17 Oct 2026	Team — authorship to confirm	Initial P1 draft based on the campus map idea.

0.1 Individual contribution record

Team member	What this person produced for P1	Evidence in repository
Riven Amdal	Coordinated the project proposal and drafted the introduction and project scope.	Commit history or document edits for Sections 1.1–1.2.
Cyril Canete	Researched campus map data sources, stakeholders, and project feasibility.	Research notes, source links, or document edits for Section 2.
Michael Dezeeuw	Prepared the context diagram and use-case diagrams.	Diagram files, commits, or pull requests.
Arsh Heer	Drafted functional requirements, quality requirements, and the traceability matrix.	Document edits for Sections 3.1–3.5.
Kaylee Vo	Drafted user characteristics, usability requirements, and accessibility considerations.	Document edits and requirements review notes.
Jay Windisch	Prepared the project schedule, risk analysis, and repository organization plan.	Document edits for Section 4 and repository task records.

1 Introduction

1.1 Purpose of this document and of the system

This document defines the proposed scope, stakeholders, assumptions, constraints, feasibility, requirements, initial use cases, project plan, risks, and open questions for the Campus Map System. It is intended for the project team, instructor, campus representatives who may provide feedback, and future team members who will use this baseline to guide later project deliverables. This is version 0.1 and must be reviewed by all team members before it is treated as an agreed baseline.

The proposed system addresses the difficulty students, visitors, and other campus users may have finding campus buildings and services, especially when they are unfamiliar with the campus. The system will provide a searchable campus map with location details and, if reliable map data and routing capability are available, walking directions and accessibility-related information. The specific institution and campus have not yet been confirmed; the team must identify the campus and validate the problem with stakeholders.

1.2 Scope

In scope — proposed first release	Out of scope — excluded from first release and why
Display a map of one selected campus and a set of approved campus locations.	Indoor turn-by-turn navigation; requires detailed indoor mapping beyond the current idea.
Search campus locations by name or category.	Live GPS tracking of users; raises privacy and implementation concerns and is not necessary for basic wayfinding.
Show location details such as building name, category, and available address/description.	Room scheduling, course registration, or student-record functions; these are separate systems and not needed for wayfinding.
Filter locations by categories agreed by the team (e.g., academic buildings, dining, parking, libraries).	Emergency dispatch or safety guarantees; the map cannot replace official campus emergency services.
Provide walking directions only if an approved routing source or campus path data is available.	Real-time shuttle/bus tracking and traffic prediction; these require external feeds not yet confirmed.
Allow authorized staff to propose or maintain location information only if the team can define a safe, manageable editing process.	Public, unmoderated edits to map data; inaccurate edits could mislead users.
Support access from a modern desktop or mobile browser as a proposed goal.	Native iOS/Android applications; a responsive web experience is a narrower first-release scope.

These exclusions keep the first release focused on finding campus places rather than attempting to replace existing university systems. Features that depend on unconfirmed data feeds, indoor maps, or institutional approval are excluded until feasibility and stakeholder needs are established.

1.3 Definitions, acronyms and abbreviations

Term	Meaning as used in this project
Campus location	A mapped place on the selected campus, such as a building, library, dining area, parking area, or service office.
Location record	The stored name, category, map position, and optional descriptive details for one campus location.
Wayfinding	Helping a user identify a place and determine how to reach it.
Routing service	An external service or data source that calculates a path between locations; its availability is not yet confirmed.
FR	Functional requirement: a capability the system shall provide.
QR	Quality requirement: a measurable property such as performance, usability, or accessibility.
CON	Constraint requirement: a rule that limits acceptable implementation choices.
MoSCoW	Priority labels: MUST, SHOULD, COULD, and WON'T for this release.
P1 / P2 / P3	Project deliverables 1, 2, and 3 in the course sequence.

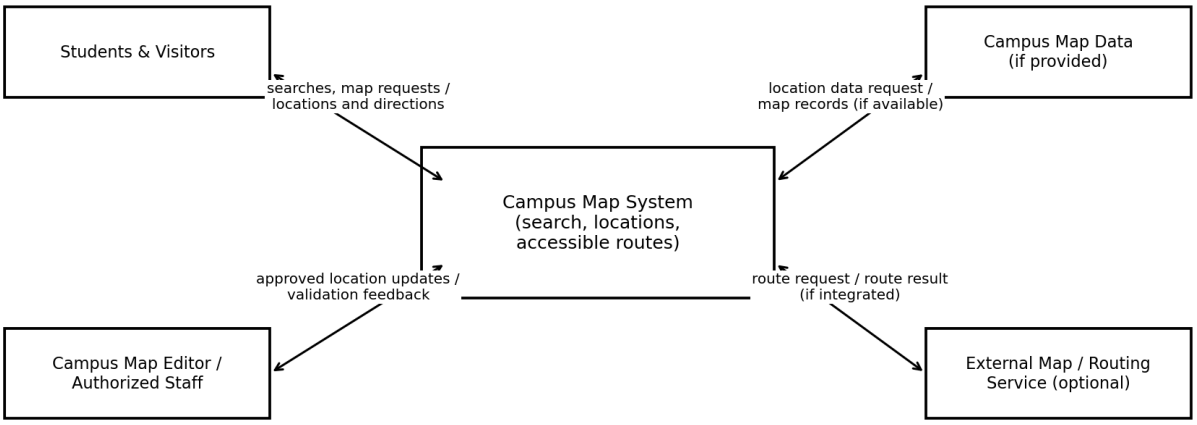

1.4 References

ID	Reference
R1	Provides campus map information to help identify campus buildings, roads, parking areas, and important locations. It will help us verify the locations and names shown in our campus map. https://map.utdallas.edu/
R2	Explains the license and attribution requirements if we use OpenStreetMap data for displaying campus locations and map features. https://www.openstreetmap.org/copyright?utm_source=chatgpt.com
R3	Provides documentation for creating interactive maps, adding markers, and displaying locations. This will be useful if the project uses Leaflet to implement the map. https://leafletjs.com/reference.html?utm_source=chatgpt.com
R4	Provides information about campus accessibility resources and a text-only campus map. This can guide accessibility considerations for users who need alternatives to a visual map. https://www.utdallas.edu/about-us/accessibility/?utm_source=chatgpt.com

2 Overall Description

2.1 Product perspective and context

Draft Context Diagram — Campus Map System

The proposed system sits between campus users and the campus location information used to display searchable places. Students and visitors request the map, search, details, and directions. Authorized staff may maintain location records if the editing function is retained. The diagram shows campus map data and an external routing service as conditional external dependencies, not as confirmed integrations. The team should revise the boundary after selecting the campus, determining the source of location data, and deciding whether routing is feasible. Anything the team does not build but relies on must remain outside the system boundary.

2.2 Stakeholders and how you reached them

Stakeholder	Role in relation to system	What they need from it	Basis / how learned
Students	Primary users	Find lecture buildings, libraries, dining, parking, and student services.	Initial stakeholder hypothesis; validate with student interviews or survey.
Campus visitors / prospective students	Primary or occasional users	Understand where destinations are and how to reach them without campus knowledge.	Initial hypothesis; validate with visitor feedback.
People with mobility or accessibility needs	Users with additional wayfinding needs	Understand accessible entrances and routes where verified data exists.	Need identified as a design consideration; consult accessibility office or users before making claims.
Campus facilities / map office	Data owner or subject-matter expert; may not use the system daily	Accurate location names, coordinates, categories, and a correction process.	Assumed stakeholder; contact and confirm authority/data availability.
University IT / web services	Potential technical stakeholder	Compatibility with university policies, hosting, privacy, and approved external services.	Assumed stakeholder; no consultation confirmed yet.
Course instructor / project evaluator	Assessment stakeholder	A testable, scoped, traceable requirements baseline and evidence of team contribution.	Based on the supplied P1 template and grading rubric.
Project team	Builders and maintainers	Clear scope, priorities, ownership, schedule, and manageable risks.	Team project context; confirm individual responsibilities.

No interviews or surveys have been reported yet. The table intentionally labels the current needs as hypotheses rather than claiming that stakeholders were interviewed. The team should record actual dates, participant roles, and notes in the repository when elicitation is completed.

2.3 User characteristics

Students are expected to have basic familiarity with web browsers and search boxes but may not know campus building names, abbreviations, or the campus layout. They may use a phone while walking, so the interface should be readable on a small screen and should avoid requiring long text entry.

Visitors may have little or no knowledge of campus terminology. Search should tolerate reasonable name/category queries, and location details should use clear names rather than unexplained abbreviations. Visitors may access the map before arriving or while on campus.

Users with accessibility needs may require step-free routes, accessible entrances, readable text, keyboard operation, or screen-reader support. The team must not promise an accessible route unless the underlying data is verified. Accessibility needs and available route data should be confirmed with appropriate campus representatives.

Authorized staff, if map editing is included, will need a clear process to add or correct location information and avoid accidental or unauthorized changes. The identity-verification method is not yet selected.

2.4 Constraints

ID	Constraint	Source	Status / consequence
C-01	The project must follow the section order and submission expectations in the P1 course template.	R1, instructor-provided template.	Confirmed course constraint.
C-02	The P1 submission is one PDF per team and is due 18 October 2026 at 11:59 PM Central.	R1, instructor-provided template.	Confirmed course constraint; export the final reviewed document to PDF.
C-03	The project must use a campus location source that the team is permitted to access and use.	To be confirmed with the selected campus and source terms.	Proposed constraint; exact policy and source must be documented.
C-04	Any selected external mapping or routing service must be usable within course, licensing, privacy, and resource limits.	Service documentation and course/team decisions; not yet selected.	Pending; do not commit to a provider until verified.

2.5 Assumptions and dependencies

ID	Assumption or dependency	What breaks if it does not hold
A1	The team will select one campus and can obtain a reliable list of relevant buildings and services.	The map cannot be populated accurately; the team must obtain permission or narrow the set of locations.
A2	A web-based map is acceptable for the course project and intended users.	The team may need to revise its delivery format or clarify expectations with the instructor.
A3	Users can access the map through a modern browser and network connection.	Offline use would not be supported; the team would need to state this limitation or add offline requirements.
D1	A usable source of campus map geometry and location data is available, or the team can manually curate a limited set.	Search and display coverage may be limited; scope may need to be reduced.
D2	If routing is included, a routing API or usable path data is available and permitted.	Walking directions must be removed or clearly treated as a future feature.
D3	The team creates a shared repository and agrees on contribution tracking.	The contribution record and review process cannot be verified reliably.

2.6 Feasibility summary

Feasibility gate	Draft verdict	Evidence / what must be checked
Technical	Conditionally feasible	A searchable list of locations and a map display are a bounded student project. Evidence still needed: selected map/data source, a small technical spike, and proof that the map can be displayed under the source's terms.
Operational	Conditionally feasible	The system has clear potential users, but campus location data and staff update ownership are not confirmed. Validate needs with students/visitors and identify an authoritative data owner.
Schedule	At risk until roles and milestones are agreed	P1 is due 18 Oct and P2 is due 8 Nov per the template. Six team members can divide

		work, but actual availability and role assignments are unknown. Agree on owners and review dates immediately.
Economic / resource	Conditionally feasible	A simple browser-based project may be possible using free or course-provided resources. No hosting, API, license, or budget decision has been confirmed; check for usage limits and potential costs.

3 Specific Requirements

The requirements below are proposed draft requirements based on the current campus map idea. The team must confirm scope, data availability, and acceptance thresholds. Each item is written to be testable and includes a priority, source, and verification method. References to optional routing or staff editing apply only if those features are retained.

3.1 Functional requirements

ID	Requirement — one shall sentence	Priority	Source	Acceptance criterion / verification
FR-01	The system shall display the selected campus map when a user opens the map page.	MUST	Students / visitors; R1	Open the map page on a supported browser and confirm that the selected campus map and map controls appear.
FR-02	The system shall display a location marker for every approved location record loaded into the release dataset.	MUST	Campus facilities (assumed); R2 pending	Compare marker count and positions against the approved test dataset.
FR-03	The system shall allow a user to search approved locations by a location name or keyword.	MUST	Students / visitors	Search for each of 10 agreed test locations and confirm the expected result appears.
FR-04	The system shall show a location's name and category when the user selects its marker or search result.	MUST	Students / visitors	Select each test location and verify the name and category match its record.
FR-05	The system shall show the available description and address fields for a selected location when those fields are present in its record.	SHOULD	Students / visitors; R2 pending	Use records with and without optional fields and verify present values display without errors.
FR-06	The system shall allow a user to filter the displayed locations by one category selected from the categories configured for the release.	SHOULD	Students / visitors	Select each configured category and verify that only matching locations remain visible in the results.
FR-07	The system shall clear the active search query when the user selects the clear-search control.	SHOULD	Students / visitors	Enter a query, activate clear, and verify the query field is empty and the full result set returns.
FR-08	The system shall display a no-results message when a search query matches no approved location records.	MUST	Students / visitors	Search a unique nonexistent term and verify a clear no-results message is shown.
FR-09	The system shall allow a user to return from a selected location's details to the map and search results.	SHOULD	Students / visitors	Open a location detail view, return, and verify the map/search context remains available.
FR-10	If routing is included in the release, the system shall display a walking route between a selected origin and destination when a valid route is	COULD	Students / visitors; R4 pending	Use origin-destination pairs with known valid routes and compare the displayed route with the source response.

	returned by the approved routing source.			
FR-11	If routing is included in the release, the system shall display a clear message when no walking route is available for the selected origin and destination.	COULD	Students / visitors; R4 pending	Use a test pair with no route and verify a failure message appears without showing a fabricated route.
FR-12	If staff editing is included in the release, the system shall allow an authorized editor to add a location record with a name, category, and map position.	COULD	Facilities / authorized editor; approval pending	With an authorized test account, add a valid record and verify it appears in the location dataset.
FR-13	If staff editing is included in the release, the system shall reject a location record submission when its required name, category, or map position is missing.	COULD	Facilities / authorized editor	Submit records missing each required field and verify the system identifies the missing field and does not save the record.
FR-14	The system shall display a data attribution notice for any external map or location source that requires attribution.	MUST	Source terms; R2/R4 pending	Inspect the map page and compare the attribution against the selected source's documented requirements.

3.2 Quality requirements

ID	Requirement — threshold, condition, method	Priority	Source	How it will be verified
QR-01	For a test dataset of up to 500 location records on the agreed supported device/browser set and a stable network, 95% of search requests shall show results within 2 seconds, measured over 50 repeated searches using browser timing tools.	SHOULD	Students / visitors; proposed target	Run 50 searches on the agreed test setup and record response times; at least 48 should complete within 2 seconds.
QR-02	On the agreed supported browser/device set with a stable network, the map page shall become usable within 5 seconds in at least 90% of 20 fresh page loads, measured using browser performance tools.	SHOULD	Students / visitors; proposed target	Perform 20 fresh loads on the defined test setup and count loads meeting the threshold.
QR-03	At a 360-pixel viewport width and a 1280-pixel viewport width, the primary map, search control, and location details shall remain usable without horizontal page scrolling, verified by manual viewport checks on the supported browser set.	MUST	Mobile and desktop users	Test both viewport widths and verify the required controls remain visible and usable.
QR-04	All primary search and location-selection functions shall be operable by keyboard without requiring a pointer, verified by completing the	SHOULD	Users with accessibility needs; proposed target	Use keyboard-only navigation to search for and open a location; document any blocker.

	search-and-select task using keyboard input only.			
QR-05	For the agreed test set of 20 invalid or empty search submissions, the system shall show a helpful empty-input or no-results state without an unhandled error in all 20 cases.	MUST	Students / visitors	Run the 20 test cases and inspect the interface and console for unhandled errors.
QR-06	For the release dataset, 100% of required location names, categories, and map positions shall match the team's approved source dataset, verified by a scripted or manual comparison before release.	MUST	Campus map data owner; R2 pending	Compare all required fields in the release dataset with the approved source and record discrepancies.

3.3 Constraint requirements

ID	Constraint — one sentence	Source	Why it cannot be negotiated
CON-01	The team shall submit one PDF containing the P1 document by 18 October 2026 at 11:59 PM Central.	R1	This is the deadline and submission format stated in the course template.
CON-02	The team shall remove all instructional blue guidance boxes and template directions from the submitted document.	R1	The template explicitly identifies these as instructions rather than submitted content.
CON-03	The team shall use only campus location and map data that it is permitted to access and redistribute or display for this project.	Campus/source terms; to be confirmed	Unlicensed or unauthorized data cannot be assumed available for use.

3.4 Initial use cases

Draft Use Case Diagram — confirm final scope and actor links

The diagram is a draft. Before submission, check that each actor association is attached to the intended use case and remove conditional use cases if the team excludes routing or staff editing. The diagram intentionally shows actor goals rather than individual system steps.

Expanded use case UC-01 — Find a campus location

Field	Content
Identifier and name	UC-01 — Find a campus location
Primary actor	Student or visitor
Supporting actors	Campus map data source (indirect; not necessarily an interactive actor).
Preconditions	The campus map page is available and the release dataset contains approved locations.
Trigger	The user wants to find a building or campus service.
Main success scenario	1. The user opens the campus map. 2. The system displays the map and search control. 3. The user enters a place name or keyword. 4. The system displays matching locations. 5. The user selects a result. 6. The system highlights the location and displays its available details. 7. The user has identified the location they need.
Alternative and exception flows	A1: The query matches no locations; the system displays a no-results message and allows the user to edit the query. A2: The query is empty; the system prompts the user to enter a name or keyword or shows the default map. A3: A location record lacks optional description data; the system still displays its available required fields.
Postconditions — success	The user has viewed a matching location and its available details; no data is changed.
Requirements realised	FR-01, FR-02, FR-03, FR-04, FR-05, FR-08, FR-09.

Expanded use case UC-02 — Get walking directions

Field	Content
Identifier and name	UC-02 — Get walking directions (conditional; retain only if routing is feasible)
Primary actor	Student or visitor
Supporting actors	Approved external routing service or campus path data source.
Preconditions	The map has loaded; origin and destination locations are selectable; routing is enabled and a valid routing source is configured.
Trigger	The user wants to know how to walk from an origin to a destination.
Main success scenario	1. The user selects a destination. 2. The user selects or enters an origin. 3. The user requests walking directions. 4. The system sends the origin and destination to the approved routing source. 5. The routing source returns a valid route. 6. The system displays the route on the map. 7. The user reviews the route.
Alternative and exception flows	A1: The source returns no route; the system explains that directions are unavailable for this pair. A2: The routing service is unavailable; the system displays a temporary-unavailable message and does not fabricate directions. A3: Origin or destination is missing; the system asks the user to select both before requesting a route.
Postconditions — success	A route supplied by the configured source is displayed; no location data is changed.
Requirements realised	FR-10 and FR-11, if routing is included; FR-01 and FR-04 support location selection.

Additional initial use cases

ID / name	Primary actor	Goal	Requirements
UC-03 — Filter campus places	Student or visitor	Narrow the map/results to a configured location category.	FR-06
UC-04 — View location details	Student or visitor	Review available details for a selected place.	FR-04, FR-05, FR-09
UC-05 — Maintain location data (conditional)	Authorized staff editor	Add a valid location record or correct the location dataset through an approved process.	FR-12, FR-13; editing process must be confirmed.

3.5 Requirements to use case traceability

Requirement ID	Use case(s) that realise it	If blank — why, and what to do
FR-01	UC-01, UC-02, UC-04	—

FR-02	UC-01, UC-04	—
FR-03	UC-01	—
FR-04	UC-01, UC-02, UC-04	—
FR-05	UC-01, UC-04	—
FR-06	UC-03	—
FR-07	UC-01	—
FR-08	UC-01	—
FR-09	UC-01, UC-04	—
FR-10	UC-02 (conditional)	If routing is excluded, remove FR-10 and UC-02 or mark as future scope.
FR-11	UC-02 (conditional)	If routing is excluded, remove FR-11 and UC-02 or mark as future scope.
FR-12	UC-05 (conditional)	If editing is excluded, remove FR-12 and UC-05.
FR-13	UC-05 (conditional)	If editing is excluded, remove FR-13 and UC-05.
FR-14	UC-01, UC-04	—
QR-01	Quality requirement; verify across UC-01 search	Quality requirement, so it is verified by performance testing rather than a distinct actor goal.
QR-02	Quality requirement; verify map page loading	Quality requirement, so it is verified by performance testing rather than a distinct actor goal.
QR-03	Applies across UC-01, UC-03, UC-04	Cross-cutting quality requirement.
QR-04	Applies across UC-01, UC-03, UC-04	Cross-cutting accessibility requirement.
QR-05	UC-01, UC-02 where enabled	Cross-cutting robustness requirement.
QR-06	UC-01, UC-04	Data-quality requirement verified against the approved dataset.
CON-01	All P1 work	Document/submission constraint, not a user-facing use case.
CON-02	All P1 work	Document-quality constraint, not a user-facing use case.
CON-03	UC-01, UC-04 and any data ingestion	Data-use constraint across the project.

What the matrix revealed, and what changed: Search, display, and detail requirements map to user-goal use cases. Performance, responsiveness, keyboard accessibility, and data accuracy are cross-cutting requirements, so they should not be forced into separate user-goal ovals. Routing and staff editing are conditional; the team must decide whether they can be supported and then either keep the requirements or remove them consistently from the scope, diagrams, and traceability matrix.

4 Project Plan

4.1 Team roles and working agreement

Team member	Proposed role for P1 to P2 (confirm)	How the team makes a decision when it disagrees
Riven Amdal	Requirements / stakeholder coordination — proposed	Discuss evidence and user needs first; record unresolved decisions and ask the instructor if scope/course interpretation is unclear.
Cyril Canete	Campus data research — proposed	Compare authoritative sources and document the source/permission decision before adopting data.
Michael Dezeeuw	Diagram and use-case coordination — proposed	Review actor goals and requirement traceability as a group; revise the shared document after agreement.
Arsh Heer	Requirements quality and traceability — proposed	Check each requirement for one shall sentence, priority, source, measurable acceptance criterion, and a matching verification method.
Kaylee Vo	Quality requirements and usability review — proposed	Use measurable thresholds and representative user tasks; document evidence and limitations.
Jay Windisch	Repository / schedule coordination — proposed	Track tasks as issues, review changes before merge, and keep the baseline and contribution evidence current.

4.2 Plan to P2

Date	What will be finished	Owner
18 Oct 2026	Complete and submit the P1 Proposal and Requirements document as one PDF.	Arsh Heer
20 Oct 2026	Identify and verify an appropriate UTD campus map and location data source, including its usage requirements.	Cyril Canete
22 Oct 2026	Review and finalize the functional requirements, quality requirements, and accessibility needs for the campus map.	Kaylee Vo
25 Oct 2026	Review the system context diagram and use-case diagram; confirm that the diagrams match the agreed project scope.	Michael Dezeeuw
29 Oct 2026	Evaluate whether walking directions can be supported with available map data; document the decision to include or exclude routing.	Riven Amdal
2 Nov 2026	Review project progress, update the risk list, and resolve outstanding questions about scope and data sources.	Jay Windisch
5 Nov 2026	Complete the P2 document updates, review requirements and traceability, and check that all diagrams and references are consistent.	All team members
8 Nov 2026	Finalize and submit the P2 deliverable after every team member reviews the document.	All team members

4.3 Risks

ID	Risk	Likelihood	Impact	Mitigation — action and owner
R1	The team cannot find an authoritative campus map/location dataset with usable terms.	Medium	High	Campus data research owner contacts the campus map/facilities office and records source permissions by 20 Oct; fallback to a small manually curated approved dataset.
R2	The team spends too much time on routing or live integrations before the basic map works.	High	High	Technical owner time-boxes a routing feasibility spike to one day; team keeps routing optional and removes FR-10/FR-11 if no feasible source is identified.
R3	The selected scope is too large for the course schedule and six-member team.	Medium	High	Requirements owner confirms MUST vs SHOULD/COULD priorities and protects the basic map, search, and details as the minimum release.
R4	Requirements are based on unverified assumptions rather than stakeholder needs.	Medium	Medium	Stakeholder owner gathers feedback from at least a small set of students/visitors or explicitly documents unresolved assumptions by 22 Oct.

R5	Individual contributions cannot be verified because repository setup or task records are missing.	Medium	High	Repository coordinator creates the shared repository and issue/commit conventions immediately; every member records their own changes and reviews.

4.4 Repository and tooling

Repository URL: [NEEDS TEAM INPUT]. The repository has not been provided, so the current draft cannot claim that a repository exists or that any commits/issues are available.

Proposed working practice: store the requirements document, diagrams, stakeholder notes, source references, and decision log in the repository. Use descriptive branches and commits; create issues for tasks and open questions; review changes before merging; and protect the submitted P1 baseline from unrecorded edits. Suggested folders are /docs, /docs/elicitation, /docs/diagrams, and /data-notes. These are recommendations for the team to adopt, not verified repository facts.

4.5 Declaration of AI tool use

Tool	What it was used for	Who used it	How output was checked
ChatGPT	Helped draft a first version of the P1 sections, requirements, use cases, diagrams, risks, and plan from the supplied template and campus map idea.	/ user initiating this request — confirm exact course disclosure wording.	Team must verify all requirements, thresholds, assumptions, campus facts, diagrams, role assignments, and dates; replace placeholders; compare the final document with the instructor's template.

The team must disclose every AI tool actually used for P1, not just the tool listed above. Each member should confirm whether they used other tools and add them. Do not claim the output was independently verified until the team has performed that check.

5 Open Questions

ID	The question	Who can answer it	Needed by	What you assumed in the meantime
Q1	Which university/campus is the map for, and what is the official campus name?	Team; instructor if project context is prescribed	18 Oct 2026	Assume one campus only; no institution-specific map claims are made.
Q2	Is an official map/location dataset available, and what are the terms for displaying it?	Campus facilities/map office or data owner	20 Oct 2026	Assume a permitted source can be identified; otherwise use a small approved dataset.
Q3	Are walking directions required for the first release, and is an external routing service permitted?	Team and instructor; source provider for technical terms	29 Oct 2026	Routing is optional and will be removed if feasibility is not demonstrated.
Q4	Should authorized staff be able to add or edit location records in the first release?	Team and campus data owner	29 Oct 2026	Staff editing is conditional and excluded from the minimum release unless ownership and authorization can be defined.
Q5	Which devices/browsers and accessibility expectations must be supported?	Instructor and intended users/accessibility representative	22 Oct 2026	Use modern desktop/mobile browsers as a proposed baseline; validate before finalizing.
Q6	Who owns each team role, final PDF submission, and the repository setup?	All six team members	18 Oct 2026	Suggested roles in section 4.1 are provisional only.

6 Baseline Declaration

We confirm that the requirements in section 3 represent our agreed baseline as of the submission date, and that every team member has read this document in full.

Team member	Signature or typed name	Date
Riven Amdal	Riven Amdal	15 October 2026
Cyril Canete	Cyril Canete	15 October 2026
Michael Dezeeuw	Michael Dezeeuw	14 October 2026
Arsh Heer	Arsh Heer	16 October 2026
Kaylee Vo	Kaylee Vo	16 October 2026
Jay Windisch	Jay Windisch	15 October 2026
